1 NAME OF MEDICINE
Sodium chloride

2 QUALITATIVE AND QUANTITATIVE COMPOSITION
Sodium Chloride Injection BP 0.9% contains sodium chloride 0.9% (9mg/mL) in Water for Injections.

For the full list of excipients, see Section 6.1 List of excipients.

3 PHARMACEUTICAL FORM
Solution for Injection.

Sodium Chloride Injection BP 0.9% is a sterile, preservative-free solution, pH 4.5-7.0

4 CLINICAL PARTICULARS
4.1 Therapeutic indications
Sodium Chloride Injection BP 0.9% can be used as the vehicle for many parenteral drugs and as an electrolyte replenisher for maintenance or replacement of deficits of extracellular fluid. It can also be used as a sterile irrigation medium.

4.2 Dose and method of administration
To be used as directed by a physician.

Parenteral drug products should be inspected prior to administration for particulate matter and discolouration. Sodium Chloride Injection BP 0.9% does not contain any antimicrobial preservatives. Care should be taken with intravenous technique to avoid injection site reactions and infections.

Dosage is dependent on the age, weight, clinical and fluid/electrolyte condition of the patient.

4.3 Contraindications
- Congestive heart failure
- Severe renal impairment
- Conditions of sodium retention and oedema
- Liver cirrhosis
- irritation during electrosurgical procedures

4.4 Special warnings and precautions for use
- Solutions containing sodium chloride should be used cautiously in patients with cardiovascular diseases such as congestive heart failure, hypertension, impaired renal function or other renal diseases such as urinary tract obstruction, pregnancy associated hypertension, pulmonary or peripheral oedema, hypoproteinæmia, those receiving corticosteroids or corticotrophin or any condition associated with sodium retention.
- Sodium chloride solutions should be used with caution in geriatric patients and infants.
- Excessive administration of sodium chloride solution may result in resulting in hypernatraemia, dehydration of internal organs, hypokalaemia and acidosis. Monitoring of fluid, electrolyte and acid-base balance may be necessary.
• When used as a vehicle for intravenous drug delivery, the Product Information document of such drugs should be checked prior to use to ensure compatibility with the sodium chloride solution. Reconstitution instructions should be read carefully.
• Do not use unless the solution is clear. The entire contents of the ampoule should be used promptly.
• Intravenous infusion during or immediately after surgery may result in sodium retention.

Use in the elderly
No data available.

Paediatric use
No data available.

Effects on laboratory tests
No data available.

4.5 Interactions with other medicines and other forms of interactions
• Additives may be incompatible with sodium chloride.
• Do not store solutions containing additives unless compatibility has been proven.
• Do not administer such preparations unless the solution is clear.
• Co-medication of drugs inducing sodium retention may exacerbate any systemic effects.

4.6 Fertility, pregnancy and lactation
Effects on fertility
No data available.

Use in pregnancy
Safety in pregnancy has not been established. Use is recommended only when clearly indicated.

Use in lactation
Safety in lactation has not yet been established. Use of this product whilst breastfeeding is recommended only when potential benefits outweigh potential risks to the newborn.

4.7 Effects on ability to drive and use machines
The effects of this medicine on a person’s ability to drive and use machines were not assessed as part of its registration.
However, adverse effects of these medicines include dizziness, which could affect the ability to drive or use machines (see Section 4.8 Adverse effects (Undesirable effects)).

4.8 Adverse effects (Undesirable effects)
• Thrombophlebitis may occur at the injection site during prolonged infusions.
• Excess intravenous administration of sodium chloride may cause hypernatraemia, hypokalaemia and acidosis.
• Hypernatraemia rarely occurs with therapeutic doses of sodium chloride, but may occur in excessive administration. A serious complication of this is dehydration of the brain causing somnolence and confusion, which may progress to convulsions, coma and ultimately respiratory failure and death. Other symptoms include thirst, reduced salivation and lachrymation, fever, tachycardia, hypertension, headache, dizziness, restlessness, weakness and irritability.
Reporting of suspected adverse effects
Reporting suspected adverse reactions after registration of the medicinal product is important. It allows continued monitoring of the benefit-risk balance of the medicinal product. Healthcare professionals are asked to report any suspected adverse reactions at www.tga.gov.au/reporting-problems.

4.9 Overdose
Symptoms of overdose:
Excess sodium chloride within the body may produce the following general gastrointestinal effects: nausea, vomiting, diarrhoea and cramps.

Salivation and lacrimation are reduced, whilst thirst and swelling are increased.

Possible other symptoms include hypotension, tachycardia, renal failure, peripheral and pulmonary oedema and respiratory arrest.

Symptoms of the CNS include headache, dizziness, irritability, restlessness, weakness, muscle twitching or rigidity, convulsions, coma and death.

Treatment of overdose:
Normal plasma sodium concentrations should be restored at no more than 10 – 15 mmol/day with IV hypotonic saline. Dialysis may be required if there is renal impairment, if plasma sodium levels are greater than 200 mmol/L or if the patient is moribund. Convulsions should be treated with diazepam.

For information on the management of overdose, contact the Poison Information Centre on 131126 (Australia).

5 PHARMACOLOGICAL PROPERTIES
5.1 Pharmacodynamic properties
Mechanism of action
Sodium Chloride Injection BP 0.9% provides a source of sodium ions (154 mmol/L), chloride ions (154 mmol/L) and water. With an osmolarity of approx. 308 mosmol/L, the product is isotonic, and therefore designated as physiological sodium chloride solution.

Sodium is the major cation of extracellular fluid and functions principally in the control of water distribution, fluid and electrolyte balance and osmotic pressure of body fluids. Chloride, the major extracellular anion, closely follows the physiological disposition of the sodium cation in maintenance of acid-base balance, isotonicity and electrodynamic characteristics of cells.

Clinical trials
No data available.

5.2 Pharmacokinetic properties
As sodium chloride intravenous preparations are directly administered to the circulation, the bioavailability of the components is 100%.

Excretion
Excess sodium is predominantly excreted by the kidneys, with small amounts lost in faeces and sweat.
5.3 Preclinical safety data

Genotoxicity
The active ingredients sodium and chloride are not mutagenic. They are basic cellular components.

Carcinogenicity
The active ingredients sodium and chloride are not carcinogenic. They are basic cellular components.

6 PHARMACEUTICAL PARTICULARS

6.1 List of excipients
Water for injections as well as hydrochloric acid and sodium chloride for pH adjustment.

6.2 Incompatibilities
Additives may be incompatible with sodium chloride.

6.3 Shelf life
In Australia, information on the shelf life can be found on the public summary of the Australian Register of Therapeutic Goods (ARTG). The expiry date can be found on the packaging.

6.4 Special precautions for storage
Store below 25°C.

6.5 Nature and contents of container
AUST R 197200 Sodium Chloride Injection BP 0.9% 5 mL ampoule (20’s)
AUST R 197198 Sodium Chloride Injection BP 0.9% 10 mL ampoule (20’s, 50’s)
AUST R 197199 Sodium Chloride Injection BP 0.9% 20 mL ampoule (20’s)

Sodium Chloride Injection BP 0.9% are available in LDPE ampoules.

*Not all pack sizes/volumes may be marketed

6.6 Special precautions for disposal
In Australia, any unused medicine or waste material should be disposed of in accordance with local requirements.

6.7 Physicochemical properties
Chemical structure
Molecular formula: NaCl
Molecular weight: 58.44

Sodium chloride is a white, crystalline powder or colourless crystals, freely soluble in water and practically insoluble in ethanol.

CAS number
7647-14-5

7 MEDICINE SCHEDULE (POISONS STANDARD)
Australia: Unscheduled
New Zealand: General Sale Medicine
